## INTRODUCTION

Performance data charts on the following pages are presented so that you may know what to expect from the airplane under various conditions, and also, to facilitate the planning of flights in detail and with reasonable accuracy. The data in the charts has been computed from actual flight tests with the airplane and engine in good condition and approximating average piloting techniques.

It should be noted that performance information presented in the range and endurance profile charts allows for 45 minutes reserve fuel at the specified power setting. Fuel flow data for cruise is based on the recommended lean mixture setting at all altitudes. Some indeterminate variables such as mixture leaning technique, fuel metering characteristics, engine and propeller condition, and air turbulence may account for variations of 10% or more in range and endurance. Therefore, it is important to utilize all available information to estimate the fuel required for the particular flight and to flight plan in a conservative manner.

## USE OF PERFORMANCE CHARTS

Performance data is presented in tabular or graphical form to illustrate the effect of different variables. Sufficiently detailed information is provided in the tables so that conservative values can be selected and used to determine the particular performance figure with reasonable accuracy.

## SAMPLE PROBLEM

The following sample flight problem utilizes information from the various charts to determine the predicted performance data for a typical flight. Assume the following information has already been determined:

### AIRPLANE CONFIGURATION:

|                |             |
|----------------|-------------|
| Takeoff weight | 2450 Pounds |
| Usable fuel    | 53 Gallons  |

### TAKEOFF CONDITIONS:

|                             |                            |
|-----------------------------|----------------------------|
| Field pressure altitude     | 1500 Feet                  |
| Temperature                 | 28°C (16°C Above Standard) |
| Wind component along runway | 12 Knot Headwind           |
| Field length                | 3500 Feet                  |

CRUISE CONDITIONS:

|                       |                    |
|-----------------------|--------------------|
| Total distance        | 320 Nautical Miles |
| Pressure altitude     | 5500 Feet          |
| Temperature           | 20° C              |
| Expected wind enroute | 10 Knot Headwind   |

LANDING CONDITIONS:

|                         |           |
|-------------------------|-----------|
| Field pressure altitude | 2000 Feet |
| Temperature             | 25° C     |
| Field length            | 3000 Feet |

TAKEOFF

The takeoff distance chart, Figure 5-5, should be consulted, keeping in mind that distances shown are based on the short field technique. Conservative distances can be established by reading the chart at the next higher value of weight, altitude and temperature. For example, in this particular sample problem, the takeoff distance information presented for a weight of 2450 pounds, pressure altitude of 2000 feet and a temperature of 30° C should be used and results in the following:

|                                            |           |
|--------------------------------------------|-----------|
| Ground roll                                | 1275 Feet |
| Total distance to clear a 50-foot obstacle | 2290 Feet |

These distances are well within the available takeoff field length. However, a correction for the effect of wind may be made based on Note 3 of the takeoff chart. The correction for a 12 knot headwind is:

$$\frac{12 \text{ Knots}}{9 \text{ Knots}} \times 10\% = 13\% \text{ Decrease}$$

This results in the following distances, corrected for wind:

|                                              |             |
|----------------------------------------------|-------------|
| Ground roll, zero wind                       | 1275        |
| Decrease in ground roll<br>(1275 feet X 13%) | <u>-166</u> |
| Corrected ground roll                        | 1109 Feet   |

|                                                          |             |
|----------------------------------------------------------|-------------|
| Total distance to clear a<br>50-foot obstacle, zero wind | 2290        |
| Decrease in total distance<br>(2290 feet X 13%)          | <u>-298</u> |
| Corrected total distance<br>to clear 50-foot obstacle    | 1992 Feet   |

CRUISE

The cruising altitude should be selected based on a consideration of trip length, winds aloft, and the airplane's performance. A typical cruising altitude and the expected wind enroute have been given for this sample problem. However, the power setting selection for cruise must be determined based on several considerations. These include the cruise performance characteristics presented in Figure 5-8, the range profile chart presented in Figure 5-9, and the endurance profile chart presented in Figure 5-10.

The relationship between power and range is illustrated by the range profile chart. Considerable fuel savings and longer range result when lower power settings are used. For this sample problem, a cruise power of approximately 65% will be used.

The cruise performance chart, Figure 5-8, is entered at 6000 feet pressure altitude and 20° C above standard temperature. These values most nearly correspond to the planned altitude and expected temperature conditions. The engine speed chosen is 2200 RPM, which results in the following:

|                  |           |
|------------------|-----------|
| Power            | 64%       |
| True airspeed    | 109 Knots |
| Cruise fuel flow | 7.3 GPH   |

**FUEL REQUIRED**

The total fuel requirement for the flight may be estimated using the performance information in Figure 5-7 and Figure 5-8. For this sample problem, Figure 5-7 shows that a climb from 2000 feet to 6000 feet requires 1.4 gallons of fuel. The corresponding distance during the climb is 10 nautical miles. These values are for a standard temperature and are sufficiently accurate for most flight planning purposes. However, a further correction for the effect of temperature may be made as noted on the climb chart. The approximate effect of a non-standard temperature is to increase the time, fuel, and distance by 10% for each 10°C above standard temperature, due to the lower rate of climb. In this case, assuming a temperature 16°C above standard (28°C - 12°C), the correction would be:

$$\frac{16^{\circ}\text{C}}{10^{\circ}\text{C}} \times 10\% = 16\% \text{ Increase}$$

With this factor included, the fuel estimate would be calculated as follows:

|                                                         |            |             |
|---------------------------------------------------------|------------|-------------|
| Fuel to climb, standard temperature                     | 1.4        |             |
| Increase due to non-standard temperature<br>(1.4 X 16%) | <u>0.2</u> |             |
| Corrected fuel to climb                                 |            | 1.6 Gallons |

Using a similar procedure for the distance to climb results in 12 nautical miles. (10 nm using chart + 1.2 nm to correct for higher than standard temperature = 11.2 nm. Rounded up to 12 nm.)

|                 |            |
|-----------------|------------|
| Total distance  | 320        |
| Climb distance  | <u>-12</u> |
| Cruise distance | 308 nm     |

The resultant cruise distance is:

With an expected 10 knot headwind, the ground speed for cruise is predicted to be:

$$\begin{array}{r} 109 \\ -10 \\ \hline 99 \text{ Knots} \end{array}$$

Therefore, the time required for the cruise portion of the trip is:

$$\frac{308 \text{ Nautical Miles}}{99 \text{ Knots}} = 3.1 \text{ Hours}$$

The fuel required for cruise is:

$$3.1 \text{ hours} \times 7.3 \text{ gallons/hour} = 22.7 \text{ Gallons}$$

A 45-minute reserve requires:

$$\frac{45}{60} \times 7.3 \text{ gallons / hour} = 5.5 \text{ Gallons}$$

The total estimated fuel required is as follows:

|                                 |              |
|---------------------------------|--------------|
| Engine start, taxi, and takeoff | 1.1          |
| Climb                           | 1.6          |
| Cruise                          | 22.7         |
| Reserve                         | <u>5.5</u>   |
| Total fuel required             | 30.9 Gallons |

Once the flight is underway, ground speed checks will provide a more accurate basis for estimating the time enroute and the corresponding fuel required to complete the trip with ample reserve.

**LANDING**

A procedure similar to takeoff should be used for estimating the landing distance at the destination airport. Figure 5-11 presents landing distance information for the short field technique. The distances corresponding to 2000 feet and 30° C are as follows:

- Ground roll 625 Feet
- Total distance to clear a 50-foot obstacle 1410 Feet

A correction for the effect of wind may be made based on Note 2 of the landing chart, using the same procedure as outlined for takeoff.

**DEMONSTRATED OPERATING TEMPERATURE**

Satisfactory engine cooling has been demonstrated for this airplane with an outside air temperature 23°C above standard. This is not to be considered as an operating limitation. Reference should be made to Section 2 for engine operating limitations.

NOTES:

- Short field technique as specified in Section 4.
- Prior to takeoff from fields above 3000 feet elevation, the mixture should be leaned to give maximum RPM in a full throttle, static runup.
- Decrease distances 10% for each 9 knots headwind. For operation with tail winds up to 10 knots, increase distances by 10% for each 2 knots.
- For operation on dry, grass runway, increase distances by 15% of the "ground roll" figure.
- Where distance value has been deleted, climb performance is minimal.

| 12,000       | -9      | 69               | 170               | 31             | 5.4           | 43       |

NOTES:

- Add 1.1 gallons of fuel for engine start, taxi and takeoff allowance.
- Mixture leaned above 3000 feet for maximum RPM.
- Increase time, fuel and distance by 10% for each 10°C above standard temperature.
- Distances shown are based on zero wind.

NOTE:

- Cruise speeds are shown for an airplane equipped with speed fairings. Without speed fairings, decrease speeds shown by 2 knots.

Figure 5-8. Cruise Performance (Sheet 2 of 2)

### RANGE PROFILE 45 MINUTES RESERVE 53 GALLONS USABLE FUEL

CONDITIONS:  
2450 Pounds  
Recommended Lean Mixture for Cruise At All Altitudes  
Standard Temperature  
Zero Wind

NOTES:

- This chart allows for the fuel used for engine start, taxi, takeoff and climb, and the distance during climb.
- Performance is shown for an airplane equipped with speed fairings, which increase the cruise speeds by approximately two knots.

NOTES:  
1. Short field technique as specified in Section 4.  
2. Decrease distances 10% for each 9 knots headwind. For operation with tail winds up to 10 knots, increase distances by 10% for each 2 knots.  
3. For operation on dry, grass runway, increase distances by 45% of the "ground roll" figure.  
4. If landing with flaps up, increase the approach speed by 7 KIAS and allow for 35% longer distances.

Figure 5-11. Short Field Landing Distance
